

21 Jan 1979

Dear Dr. Wallace

If at all possible let's try to get the following records on one each male & female of the group you are now doing. I would want to look at their normal record (what you are now doing) and then keep them as close to absolute horizontal as possible for 24 hrs but awake & mentally active during normal non-sleep hours & sleep as close as possible to their previously recorded time. Then after 3-4 days the normal study should be repeated. The blood-urine studies would help. If need be I'll personally pay the subject fees.

May be chasing moon beams on the records of HR-BP relations may be flukes but its too striking ~~to~~ not to follow - look more closely.

Sincerely
Bill
