### APOLLO 15 FOOD SYSTEM

The food system for the Apollo 15 Command Module (CM) included a new stowage area in the A-7 locker, in addition to the lower equipment bay (LEB) and the left hand equipment bay (LHEB) food containers. Three new stowage areas were also utilized in the Lunar Module (LM). One container was located in the ascent stage (A/S) on the aft bulkhead and 2 stowage areas in the descent stage (D/S). Table 1 and 2 outlines the food orientation for the CM and LM, respectively.

The CM food for the first 10 days of the mission was arranged in meal packages and was supplemented with food from the pantry. For the remainder of the mission the crewmen selected food for their meals from the pantry on a realtime preference basis. The 4-day menu cycle for the Command Module is shown in Table 3 and the contents of the pantry are listed in Table 4. Table 5 shows the LM menu.

The menus were designed to provide approximately 2400 Kilocalories per man per day, with 400 additional calories in beverages and foods supplied in the pantry for a total of 2800 calories per man per day. Preliminary estimations of food consumption, derived from the onboard logs and returned foods, indicate that an average of 2892, 2372, and 2568 Kilocalories per day were consumed by the CDR, CMP, and LMP, respectively.

New foods included in the menu for this mission were: a) freeze dehydrated Romaine Soup and Crab Mushroom Soup, b) thermostabilized (wet pack) Beef Steak and Hamburger, c) intermediate moisture Apricot

Food Bar and Tropical Chocolate Bar, and d) a Citrus Beverage powder.

There were a total of 562 primary food packages in the CM food system and 99 in the LM. The package types and quantities are outlined in Table 6.

### PREFLIGHT

The crew selected their menu after evaluating about 100 available flight food items. Crewmembers were briefed on spacecraft stowage, food preparation procedures, opening the canned food items, and waste storage.

As on the previous 4 missions, after suiting up and prior to departure for the launch pad on F-O, each crewman was supplied with a specially prepared and packaged frozen sandwich, a package of bacon squares and a beverage powder. These items were stowed in a suit pocket for consumption within 6 to 8 hours after launch. The sandwiches were prepared in the MSC Food and Nutrition Laboratory with Quality Control inspection and met all applicable spacecraft and food system requirements.

### INFLIGHT

Comments on the quality of the inflight foods and the food systems were favorable. The crew commented that they were very satisfied with the food supplied for this mission. They recommended that additional food be stowed on the LM. The crew supplemented the LM food supply with food from the CM pantry. The inflight food consumption logs were maintained by the crew throughout most of the mission. All crewmembers adhered to and consumed the food as presented in the programmed menu plus additional food items, snacks, and beverages from the pantry. The crew commented that they would have preferred to have packaged meals throughout the mission, but the pantry should not be eliminated.

As on Apollo 14, evaluation and observations were made on the use of nominal moisture thermostabilized food items packaged in aluminum cans with full pull-out lids. This crew reported that they carefully removed the lids and encountered difficulty initially with some dispersion of food and liquid, however, after the initial opening there were no problems in consuming the food.

The crew reported the flavor of both the CM and LM water was good, however, there was some gas in the CM water supply. The amount of gas increased with utilization, but the quantity apparantly did not interfere with food rehydration.

The crew encountered problems with using the in-suit drinking device, thus, the quantity of water consumed during the EVA periods was less than anticipated. On EVA-1, the CDR consumed about 16 ounces, while

the LMP was unable to drink water from the device. During EVA-2, the CDR's drinking device slipped under the neck ring and he was unable to drink water. Following EVA-2, both the CDR and the LMP consumed the contents, approximately 32 ounces, to conserve vehicle water. The in-suit drinking device was not used during the third EVA.

The in-suit food bar assembly was utilized successfully on both EVA-1 and 2. The assembly consisted of an apricot food bar, measuring 9"xl"xl/4", in an elastic pouch dispenser. The assembly is attached to the in-suit drinking device and then is installed in the suit where it is attached to the helmet neck ring as shown in Figure 1 and 2.
