SMEAT LOG - CDR

We finally made it, after many months of hard work by everybody. The send off was heartening. A lot of people turned out.

The chamber looks good with only small discrepancies noted. It almost seems as though we are going through another training exercise. The internal gas problem is not nearly as bad as we had in the wet run.

2/209

Everyone got a good night's sleep. We are progressing with only minor hitches. There was a misunderstanding over our initial Environmental Noise audiometric exam. I think it occurred that we up. The COMC decided to change comm rules on us about losing data and to interrupt for the first week. That was rather disappointing in that it fell so quickly. The totally unexpected happened.

Owen's ergometer failed. We made use of the manlock transfer procedures - good planning. Skylab would have had a hard time doing that.

Bill had a bright flash occur after he went to bed that came from his reading lamp. Power was secured from same before retiring.

3/210 We got the ergometer back today and ran a full set of experiments (Bo didn't repeat the M092). Everything behaved about normal. The M171 data still looks a little squirrely. We've got a temporary restriction against using the ergometer for exercise & until they can figure out why the generator failed.

I had to give up on the M133 cap this evening. The headsets was back. I'll try it again tomorrow night.

4/21 (SAT)

We tried blood drawing again this morning. An anticoagulant was passed in that we added to the ASPS. This seemed to stop clotting. The vacuum line still didn't adequately evacuate the ASPS. We had to force about 5ml. The centrifuge was really rattling even though it was unbalanced. I

Dick Johnston told us we could exercise with simulators as follows.

200 watts - 15 min (Rest 10)

150 watts - 30 min.

Further work will be received by Ued.

5/212 (SUN)

This was our first day off or was supposed to be. Steve spent the better part of it preparing and giving a report summarizing our pre SMEAT activities. It was enjoyable to have a day to just relax. Our attempts to make sure we were busy have been successful thus far.

6/213/ (MON)

Another major med day.
The equipment behaved about
normal. We also find another
Russian lesion which is going
to prove to be one of our
most interesting endeavors.

7/214 (TUES) We got a
Monarch ergometer in today
for Bill to use for exercise.
Bo and I will continue
to use the S.L. unit but
we are limited to 150 watts.

8/215 (Wed) today we
ran a special exercise
on 171 to see if they could
get a hang for what
was causing the problem.

Bo now has the
problem of the M133 unit.
They decided my head
swore too much.

9/216 (THUR) Another major
med day with nothing
very exciting.

10/217 FRI Mainly classes
today. That Runway is
really fun (Da). We need
to something about these
movies; Bad, Bad.

11/218 SAT Our second
day off: Like heck. We
spent the better part
of the day on our weekly
report.

12/219 No Comment

13/220 No Comment

14/221 We had our first in-chamber
news conf - Not very exciting. We
had fair coverage.

15/222 Another day of May
Mede (92/93). The LBNPD really
blew in on me because I didn't
get the iris down - Dumb!
