Notes on Treadmill, Shuttle

Spent two hours with Whitmore on various aspects of the treadmill prototypes. The items which are needed now are exact dimensions, layout and load bearing capacity of the proposed installation area in Shuttle.

The prototype, which now has the constant speed governor and an accurate speedometer, needs testing. Current plans are to take the unit to Buchanan at KSC where there is complete instrumentation including metabolic gas analysis and a standard treadmill to allow comparison on the units. He still needs a tactometer to mount for exact speed instrumentation which we will record during the runs at KSC. I will attempt to scrounge such a tactometer as soon as possible and move the unit as time allows.

3/18 . Obtained proposed dimensions from Horsman
& looked at
